

FLEET AI - ROUTE OPTIMIZATION

Plan perfect routes in seconds, cut costs by double digits, and deliver 99 % on-time—no spreadsheets required. Fleet's route optimization engine considers all possible routes, and finds the shortest possible way to deliver all your deliveries, cutting distance travelled by 30%. Fleet also optimizes on vehicle load utilization by comparing delivery weights with vehicle load capacity ensuring fully loaded vehicles. Cost per kilometer, kg, fuel consumption, traffic, restriction (county permits), vehicle speed and other factors are all considered and configurable.

The optimizer also allows you to set up KPIs per route, be it revenue based, or restricting vehicles to assign counties, or wards, or balancing workload among vehicles and much more.

Fleet calculates the distance by road, traffic, time required per stop, travel time and provides you estimated cost, and estimated time of arrivals for each stop in the route.

Routes	Allocation	T. Destinations	Assigned	Unassigned	Cost	Revenue	Cubes	Pieces	Weight	Fill Rate
14	53%	496	262	234	72871.00	0.00	0.00	0	20652.00	34%

Each vehicle's route can be visualized on a Gantt time-line chart, you are also able to compare planned vs executed routes for the day, week or month. Each stop made is geo-fenced, on-time rate and time on site auto-matically reported.

☐ Driving ☐ Stop ☐ Waiting ☐ Break

Fleet provides real time alerts throughout each vehicle's route, alerts include temperature thresholds throughout the trip, route deviation (if vehicle deviates from the path) , late and on-time alerts and more.

Vehicle	OrderID	OrderRef	Sequence	Cumulative Distance	Departure Time	Arrival Time	service time	waiting time belt weight	Location	Contact	Customer Delive	Transporter Cost
Dyna (KCR 749/ #217318		47590	1	43.362	8:00 AM	8:30 AM	5 Min	0 Min	500 South Kabras		0	
Dyna (KCR 749/ #216932		47359	2	68.354	8:35 AM	10:25 AM	35 Min	0 Min	250 Murhanda		0	
Dyna (KCR 749/ #217127		47433	3	73.377	11:00 AM	11:47 AM	5 Min	0 Min	500 Isukha Central		0	
Dyna (KCR 749/ #217005		47551	4	158.102			5 Min	0 Min	100 Songhor/Soba		0	
Dyna (KCR 749/ #216997		47558	5	223.685			5 Min	0 Min	250 Anabkoy/Dlana		0	
Duration 06hrs 28 minutes												
GMY 0												
Distance 359.152 Kms												
Expected Consumption												
Total Vehicle Weights: 2000.00 Kgs												
Loaded Capacity (LC): 1600.00 Kgs												
Load Utilization Rate: 80%												

You are able to customize the route optimization engine to behave according to your business requirements. You can set up revenue constraints, time-window constraints, load fill rate constraints and much more. For example, no truck should receive a route without 80% fill rate (e.g. 8,000KGs Loaded into a 10,000KGs load capacity truck) . This gives you full control of your logistics operations using technology.

Optimization Settings

Configure how routes will be optimized.

General **\$ KPIs** Breaks Driver Cost

Enable Revenue Constraints

When disabled, revenue constraints are not considered when generating routes.

Capacity Utilization

Enable Capacity Constraints

When disabled, capacity constraints are not considered. When enabled, vehicle/driver capacity limits will be respected.

Minimum Fill Rate (%)

0%Current: 0%100%

Minimum percentage of vehicle capacity that must be utilized

Maximum Fill Rate (%)

0%Current: 100%100%

Maximum percentage of vehicle capacity that can be utilized

Vehicle routing options

- ☒ Use start point only -> End route at last address
- ☐ Use end point only -> Start route from furthest/last address
- ☐ Return to start -> (Round trip)

Order collection options

- ☐ Multi-pick & multi-drop
- ☒ Single pick-up & multi-drop

ROUTE OPTIMIZER – KEY FEATURES

#	Feature	What It Delivers	Compliance Sheet To be completed by the Bidder with the required "Relevant Information", duly signed and submitted with the Bid
1	AI-Driven Constraints Engine	Balances time windows, vehicle capacity, driver hours, customer priorities and road restrictions in milliseconds.	
2	Real-Time Traffic & Weather Feeds	Dynamically reroutes around jams, accidents and storms to keep ETAs accurate.	
3	Dynamic Re-Optimization	Re-plans the entire day when new orders drop in, a driver breaks down, or a customer changes the address – no manual drag-and-drop.	
4	Load & Capacity Balancer	Maximises cube/weight utilisation and avoids partial loads; supports mixed fleet (trucks, vans, bikes).	
5	What-If Scenario Simulator	Model "what if we add a new depot?" or "what if we change cut-off times?" before committing.	
6	Geofence & Priority Zones	Prioritize high-value zones, restrict sensitive areas, and auto-enforce delivery curfews.	
7	Open API & Webhooks	Seamless push/pull with TMS, WMS, ERP or e-commerce checkout in real time.	
8	Driver-First Mobile App	Turn-by-turn navigation, proof-of-delivery capture, and instant route updates in the driver's language.
